**Subject:** Garcia Well PW9

This e-mail is in reference to PW 9 whose well data is described in a study titled "Survey of Uranium and Radon in Private Wells in Kleberg County" authored by Yaneth Gamboa, Waldy Fernandez, and Dr. Lee Clapp of the Department of Environmental Engineering, Texas A & M University-Kingsville dated 2010. I spoke to Dr. Lee Clapp about the location of PW 9 whose water quality data is graphed in his study and he referred me to Yaneth Gamboa, his research assistant. I called Yaneth Gamboa and, after conferring with Dr. Clapp, was able to confirm that the location of PW 9 was the Garcia Well. She stated that she collected the water sample from the Garcia well located next to the storage tank in Garcia Hill and that the Uranium level was 770.75 ug/L and that the radon concentration was 1840.0 pCi/L for that well. I checked information that I had and noted that PW 9 was URI/Kingsville Dome Project W-24 well and I also noted that W-25 was not operational at the time and W-25 was not factored in the water quality results and that W-24 was the only operational well at the time and it is located next to the big storage tank.
